

InspectTech's BridgeInspect™ Collector streamlines the bridge inspection process, making inspectors more efficient and producing higher quality reports. BridgeInspect™ Collector is an easy to use software package that runs on laptops or tablet computers. Using the software, inspectors are able to generate a complete, nicely formatted bridge inspection report with the click of a button. InspectTech works with inspectors to quickly customize the software to meet any local requirements (forms or layout).

Main Collection Screen:

All state/county forms and other necessary data screens are easily accessible via tabs across the top of the screen.

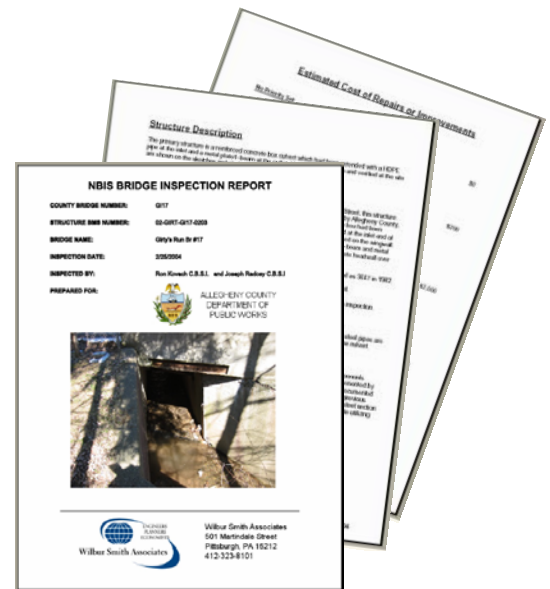

The right sidebar shows information on the selected field (see yellow circle). For fields with options, a drop down select list is available. Selecting an option from the list automatically updates the value in the form.

Manual pages describing the field are shown as thumbnails and can be viewed full size by double-clicking on them.

The main window (left side) shows the selected data form/entry screen. The layout is nearly identical to the paper form.

Other Features Include:

- Pictures, sketches, and other files can be loaded directly into BridgeInspect™ Collector. Thumbnails are automatically generated to allow for pictures to be reordered and descriptions to be entered.
- BridgeInspect™ Collector provides all the necessary entry screens to generate a complete report. The report is generated as an Adobe PDF file. Footers, page numbers, and a table of contents are automatically generated.
- Maintenance cost estimates are simplified by linking maintenance items selected to known unit cost estimates from the state DOT.
- BridgeInspect™ Collector stores all of the collected data in its internal database. Once a bridge is inspected, most information does not need to be re-entered. Reports and forms can be automatically pre-populated from the past report. Only fields that have changed need to be edited.
- Collector easily integrates with GPS devices allowing coordinates to be directly entered into the report.
